

## F • Adjacent Bit Counts

For a string of  $n$  bits  $x_1, x_2, x_3, \dots, x_n$ , the *adjacent bit count* of the string ( $\text{AdjBC}(\mathbf{x})$ ) is given by

$$x_1 * x_2 + x_2 * x_3 + x_3 * x_4 + \dots + x_{n-1} * x_n$$

which counts the number of times a 1 bit is adjacent to another 1 bit. For example:

$$\text{AdjBC}(011101101) = 3$$

$$\text{AdjBC}(111101101) = 4$$

$$\text{AdjBC}(010101010) = 0$$

Write a program which takes as input integers  $n$  and  $k$  and returns the number of bit strings  $\mathbf{x}$  of  $n$  bits (out of  $2^n$ ) that satisfy  $\text{AdjBC}(\mathbf{x}) = k$ . For example, for 5 bit strings, there are 6 ways of getting  $\text{AdjBC}(\mathbf{x}) = 2$ :

11100, 01110, 00111, 10111, 11101, 11011

### Input

The first line of input contains a single integer  $P$ , ( $1 \leq P \leq 1000$ ), which is the number of data sets that follow. Each data set is a single line that contains the data set number, followed by a space, followed by a decimal integer giving the number ( $n$ ) of bits in the bit strings, followed by a single space, followed by a decimal integer ( $k$ ) giving the desired adjacent bit count. The number of bits ( $n$ ) will not be greater than 100 and the parameters  $n$  and  $k$  will be chosen so that the result will fit in a *signed* 32-bit integer.

### Output

For each data set there is one line of output. It contains the data set number followed by a single space, followed by the number of  $n$ -bit strings with adjacent bit count equal to  $k$ .

Sample Input	Sample Output
10	1 6
1 5 2	2 63426
2 20 8	3 1861225
3 30 17	4 168212501
4 40 24	5 44874764
5 50 37	6 160916
6 60 52	7 22937308
7 70 59	8 99167
8 80 73	9 15476
9 90 84	10 23076518
